Table 1: Hypothetical Data Matrix Containing Four Variables and Twenty Observations.

Observation:	X ₁	X ₂	X ₃	X ₄
1	32.3	33.2	24.7	29.7
2	28.0	34.2	29.4	30.2
3	31.4	27.0	28.5	28.7
4	29.5	33.0	25.6	27.3
5	40.0	35.8	27.6	31.3
6	20.0	34.6	32.0	29.5
7	26.0	24.2	28.2	26.3
8	28.6	34.9	40.9	29.9
9	27.7	25.1	37.5	29.8
10	27.0	37.3	26.3	30.1
11	17.5	22.7	33.9	37.9
12	31.0	25.4	36.7	27.6
13	32.0	25.8	25.2	30.3
14	30.5	38.2	23.8	22.1
15	34.0	26.5	26.1	28.1
16	42.5	38.4	28.2	26.5
17	35.0	26.8	31.8	30.5
18	29.0	21.6	39.7	27.4
19	25.0	33.5	19.1	51.0
20	33.0	21.8	34.8	25.8
Mean:	30.0	30.0	30.0	30.0
Standard Deviation:	5.8	5.8	5.8	5.8

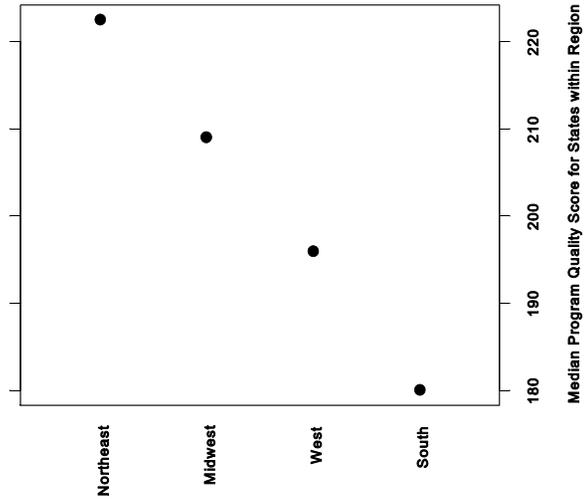

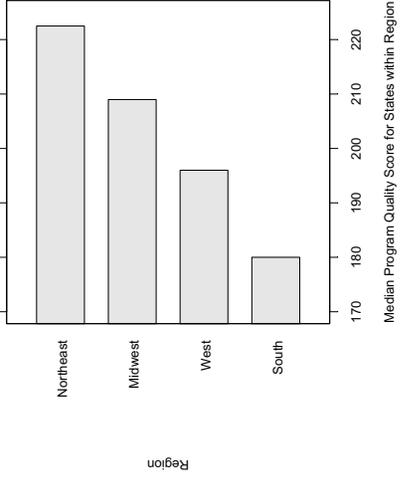

Figure 19: Bar Charts, Scale Limits, and Visual Perception

A. Scale Minimum Value Set Arbitrarily

B. Minimum Scale Value Set to Zero

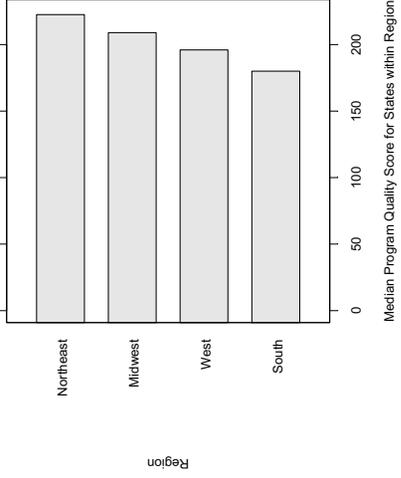

Figure 20: Dot Plot Showing 1992 Social Welfare Expenditures in the American States.

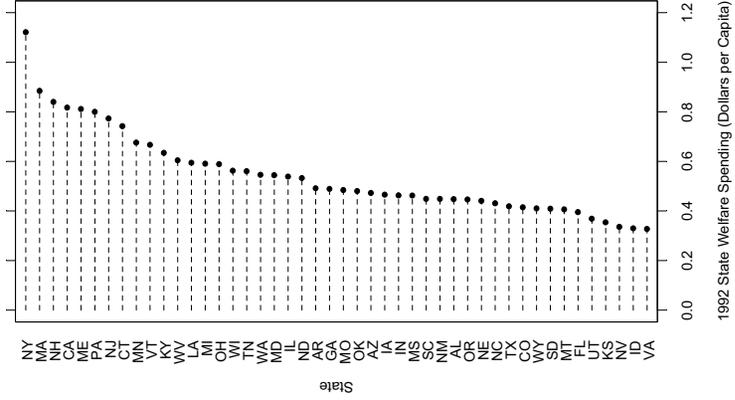

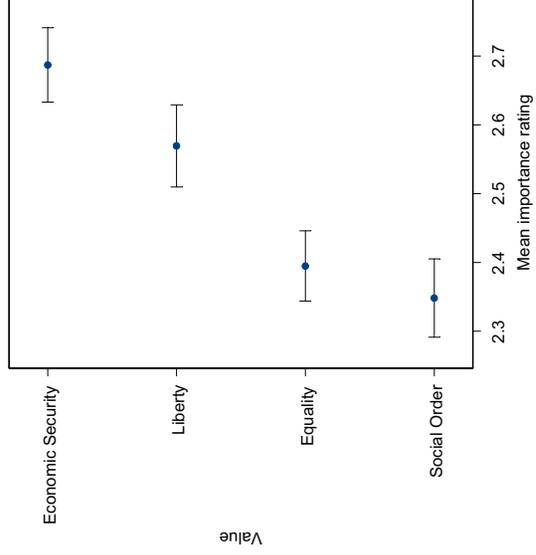

Figure 21: Value Importance Ratings in the American Public.

Note: The plotted points correspond to the mean importance rating assigned to each of the values, on a scale ranging from a minimum of zero to a maximum of three. The horizontal error bars show 95% confidence intervals for each of the means. Nonoverlapping confidence intervals imply that the means are reliably different from each other, that is, their difference is probably *not* merely due to sampling error.

Data Source: 1994 Multi-Investigator Study.

STATISTICAL GRAPHICS FOR VISUALIZING DATA

Tables and Figures, III

William Jacoby
Michigan State University and ICPSR

University of Illinois at Chicago
October 14-15, 2010

<http://polisci.msu.edu/jacoby/uic/graphics>

Table 1: The following table shows four bivariate datasets. Each one contains eleven hypothetical observations on two variables. The variables are designated X_1 and Y_1 in the first dataset, X_2 and Y_2 in the second dataset, and so on. These datasets have a remarkable feature: They produce identical regression results. When the Y variable is regressed on the X variable in each of these datasets, the following equation is produced (the figures in parentheses are standard errors):

$$Y_i = 3.00 + 0.50 X_i + e_i \quad R^2 = 0.67$$

(1.12) (0.12)

Because the OLS estimates are identical for each of the four datasets, one could easily conclude that they all have the same bivariate structure.

X_1	Y_1	X_2	Y_2	X_3	Y_3	X_4	Y_4
10.0	8.04	10.0	9.14	10.0	7.46	8.0	6.58
8.0	6.95	8.0	8.14	8.0	6.77	8.0	5.76
13.0	7.58	13.0	8.74	13.0	12.74	8.0	7.71
9.0	8.81	9.0	8.77	9.0	7.11	8.0	8.84
11.0	8.33	11.0	9.26	11.0	7.81	8.0	8.47
14.0	9.96	14.0	8.10	14.0	8.84	8.0	7.04
6.0	7.24	6.0	6.13	6.0	6.08	8.0	5.25
4.0	4.26	4.0	3.10	4.0	5.39	19.0	12.50
12.0	10.84	12.0	9.13	12.0	8.15	8.0	5.56
7.0	4.82	7.0	7.26	7.0	6.42	8.0	7.91
5.0	5.68	5.0	4.74	5.0	5.73	8.0	6.89

Data Source: Anscombe, F. J. (1973) "Graphs in Statistical Analysis." *American Statistician* 27: 17-21.

Figure 1: The following bivariate scatterplots show the relationships within each of the four datasets listed in Table 1. Clearly, these datasets differ markedly from each other, contrary to the conclusions that one might reach based upon the OLS regression estimates, alone.
